

## Pretend DevSecOps

## True DevSecOps

+ Daily builds done — but often broken

*Pretend DevSecOps*

### CONTINUOUS INTEGRATION (CI)

*True DevSecOps*  
**Confidence in infrastructure 24/7** 💡

+ Daily builds include infrastructure  
+ Teams ensure the build is sound

+ Relies on text-based deployment instructions  
+ Process is slow and open to errors

*Pretend DevSecOps*

### CONTINUOUS DEPLOYMENT

*True DevSecOps*  
**Almost 100% uptime, lower cost** 💡

+ Automated daily deployments incorporate every enhancement  
+ For necessary push-button deployments, container management software (Kubernetes, Rancher AgroCD) ensures fast, orderly Process

+ Environments configured via the console  
+ Disparate steps and guides leave test and ops environment out of sync

*Pretend DevSecOps*

### INFRASTRUCTURE AS CODE (IAC)

*True DevSecOps*  
**Environment parity ensures efficiency** 💡

+ Environments built out with one click using IaC tools (Ansible, Chef, Terraform)  
+ Infrastructure deployments are automated (GitOps)  
+ Standardization saves time, lower errors

+ Run scans before deployment to address high-priority findings only  
+ Deployed code therefore contains faults to be fixed "when there's time"

*Pretend DevSecOps*

### SECURITY

*True DevSecOps*  
**Less risk, faster delivery at less cost** 💡

+ Automated security tools scan code, finding and correcting issues before deployment  
+ Deployment systems are scanned daily (IaC process)  
+ Daily build includes continuous monitoring

+ Bugs accidentally deployed need manual resolution  
+ Task goes on the to-do list or takes time from that day's development schedule

*Pretend DevSecOps*

### HOTFIX

*True DevSecOps*  
**Fast fixes speed progress, lower risk** 💡

+ Code is strictly version-controlled  
+ Issues are rapidly identified down to "commit" stage  
+ Capability can be instantly rolled back to previous healthy state for double protection

+ System goes down for routine developments  
+ Hours of downtime creates frustration and delays

*Pretend DevSecOps*

### DEPLOYMENT DOWNTIME

*True DevSecOps*  
**Safer deployments, little or no downtime** 💡

+ Advanced release strategies (traffic splitting, blue-green and canary deployments) accelerates process

+ Pipeline tool chain is automated only for deployment  
+ Developers need to do manual integrations for each application or service  
+ Separate processes slow development

*Pretend DevSecOps*

### AUTOMATION

*True DevSecOps*  
**Single-click processes accelerate delivery** 💡

+ Enhanced tool chain (scripts, plug-ins, glue code) ensures fully automated, end-to-end integration  
+ Single-click build and deployment

+ Capability releases go to operations quickly, but deployment is held up for security approval  
+ Manual approval takes time and is open to error

*Pretend DevSecOps*

### OPS ACCREDITATION

*True DevSecOps*  
**On-demand ops save time, lowers risk** 💡

+ Security compliance and checks are integrated in automated pipelines for rapid capability deployments  
+ Ensures compliance, eliminates manual security approvals
